MYGIVE is freeware from GreenHouse Software & Consulting

MYGIVE gives all files, matching a given file name template, to a new owner.
In contrast to the FUP GIVE command, this tool allows even volume wildcards, which is not supported by FUP.

To successfully give all files to a new owner, the MYGIVE user has to be the owner of the files to be given.

Command syntax is:

  [run] MYGIVE [/OUT [<file>]/] <template>[,] <ID>|<name>

where

  <file>        OUT file name
                when empty, the output is suppressed
  <template>    file name template of files to be checked
  <ID>          user ID, e.g. 100,5
  <name>        GUARDIAN or Alias name

e.g.

  MYGIVE *,100,5                          gives all files in the
                                          current location of the
                                          new owner 100,5

  MYGIVE $SYSTEM.SYS*.*,GHS.MARTIN        gives all files, matching
                                          $SYSTEM.SYS*.* to user
                                          GHS.MARTIN

  MYGIVE/OUT/ZZBI*,Carlito                gives all ZZBI*-files in
                                          the current location of the
                                          MYGIVE user to the ID of the
                                          alias user carlito;
                                          suppresses the output
