

NoACL is a FreeWare tool from GreenHouse. It displays all disk files, lacking a relevant ACL.

Command syntax:

```
NOACL[/OUT <file>/][ -H ]|<template>]
```

where

-H causes NOACL to display this screen.

<template> is a valid disk file name template.  
Network names are NOT supported.  
In case no <template> is supplied, the files  
from the users current location are evaluated.

e.g.

```
NOACL  
NOACL $GHS?.*.EXEC*
```

Inconsistent SFG bit settings are cleared as well, when NOACL is started from SUPER.SUPER.
